**What is Ubiquity™?**

**u•biq•ui•ty (noun):** the state of being, or seeming to be, everywhere at once

Ubiquity™ is a powerful building management system that allows facility managers to be “everywhere at once” via the Internet.

---

---

---

---

---

---

---

---

### What is Ubiquity™?

Ubiquity™ combines the local building control network (made up of TCS hardware) with a centrally hosted Web application that sends, receives, stores, and processes building control data.

Ubiquity™ coordinates with hundreds of these sites and then routes information to designated recipients.

---

---

---

---

---

---

---

---

### What is Ubiquity™?

- A centrally hosted software package accessed through a standard browser interface (no additional software required)
- A control, monitoring and alarming package
- An extensible and scalable application with capabilities to import and export data
- An enterprise-wide asset protection package

© Temperature Control Specialists Company, Inc.

---

---

---

---

---

---

---

---

### The Ubiquity™ Advantage

- Ease of Use
- Multiple Tiers of Users
- Centrally Hosted Server
- Enhances Building Intelligence
- All Information is Recorded
- Utilizes Current TCS Hardware
- Expanded Features
- Software Always Current
- Security & Redundancy
- Adaptable for New Technologies
- Tremendous ROI Opportunities

---

---

---

---

---

---

---

---

## Ubiquity™ Security

- **All communications between the Gateway and server are encrypted**
- **Sensitive communications are SSL enabled**
- **Restricted capabilities of Communication Gateway**
- **Secure log-in on Ubiquity site**
- **Server can be hosted locally**

© Temperature Control Specialists Company, Inc.

---

---

---

---

---

---

---

---

## Central Server Protection

- **Server cluster with RAID configuration**

The server cluster utilizes a clustering software packages that allows failures to occur with individual servers, while still remaining online. The RAID configuration writes data to multiple locations to minimize the chances for data corruption.
- **Secure co-location facility**

The Ubiquity co-lo facility has the latest in keycard and server rack security. It also includes numerous Internet & power redundancies, dry fire suppression technologies and a disaster proof infrastructure.

---

---

---

---

---

---

---

---

## Central Server Protection -- continued

- **Regular off-site back-up**

All data is backed up regularly at an offsite location.
- **Failover server**

An offsite server provides essential services (Site monitoring, programming & scheduling, and alarms) in the event of a catastrophic failure with the main server cluster.
- **Latest software updates**

TCS installs and maintains the latest security and functionality updates for the Ubiquity application components.

**Gateway Options -- QD2040 (Multi-Function)**

- Embedded web server with graphical interface
- Server software for on-site access/commissioning
- Built in software application for pre-installation controller addressing/programming
- Works with centrally hosted Ubiquity server
- Firmware upgradeable
- More robust CZS, VAV, & Water Loop control
- Local & remote alarms – can alarm out if ISP connection is lost
- Implement energy policies to both alarm points as well as take corrective action

**Energy – Ubiquity Manual Section 11**

- **Utilities break down energy into two components:**

**Demand  
and  
Consumption**

© Temperature Control Specialists Company, Inc.

---

---

---

---

---

---

---

---

**Energy – Ubiquity Manual Section 11 – cont'd.**

**–Demand**

**Is measured in kW and represents the instantaneous load on the electrical circuit.**

*Since there is no way to store electricity this is very important to a utility.*

© Temperature Control Specialists Company, Inc.

---

---

---

---

---

---

---

---

**Energy – Ubiquity Manual Section 11 – cont’d.**

When billing commercial properties Utilities assess a demand charge. This is based off of the **“Maximum Demand”** set for the month.

**Maximum Demand** is often pre-negotiated with the utility. If the commercial property can come underneath what they estimated they receive significant savings. If they exceed it they are often penalized heavily.

© Temperature Control Specialists Company, Inc.

---

---

---

---

---

---

---

---

**Energy – Ubiquity Manual Section 11 – cont’d.**

**Maximum Demand** is calculated by the high average reading over a 15 - 30 minute interval.

This remains the charge for the entire month.

Typically the Utility will then bill from that maximum demand a charge between \$5 and \$25 per kW.

© Temperature Control Specialists Company, Inc.

---

---

---

---

---

---

---

---

**Energy – Ubiquity Manual Section 11 – cont’d.**

**Demand** charges oftentimes account for 50% of the total Energy bill, and in the summer or during “Emergency” periods can account for a much larger percentage.

© Temperature Control Specialists Company, Inc.

---

---

---

---

---

---

---

---

**Energy – Ubiquity Manual Section 11 – cont'd.**

**–Consumption**

**Is measured in kWh and represents the amount of electricity used at the facility. Consumption is calculated as demand over an hour.**

*FYI – Ten 100-watt light bulbs that are on for an hour would equate to 1 kWh.*

---

---

---

---

---

---

---

---

**Energy – Ubiquity Manual Section 11 – cont'd.**

Like its name denotes, **consumption** represents the amount of electricity the site has consumed during the month.

Unlike demand, the **consumption** is charged differently depending on the time of day. In larger markets this usually is broken up into three periods with the time between 10:00am - 4:00pm being the most expensive time.

© Temperature Control Specialists Company, Inc.

---

---

---

---

---

---

---

---

**Energy – Ubiquity Manual Section 11 – cont'd.**

**Breakdown of a Bill –**

If a facility runs a max demand of 50 kW and utilizes 6000 kWh during the peak period and 3000 during an off-peak time over the summer period.

Demand	50 X \$12.00 per Kw = \$600
Summer Peak Charge	50 X \$5.00 per Kw = \$250
Peak Consumption	6000 X .14 per Kwh = \$840
Off-Peak Consumption	3000 X .10 per Kwh = \$300

Total for Bill	<b>\$1990</b>
	<i>(43% from Demand Charges)</i>
